

Appointo-multivendor Setup Documentation

Created by: Vikash Singh Tanwar

Modified on: Wed, 22 Sep, 2021 at 5:52 PM

Quick Installation & Getting Started Tutorial

1. Server Requirements

- PHP >= 7.2.5
- OpenSSL PHP Extension
- PDO PHP Extension
- Mbstring PHP Extension
- GD PHP Extension
- Fileinfo PHP Extension

2. Configure Database

Login to cPanel and create a brand new database that will be used for Appointo-multivendor installation.

You can check this tutorial on **[how to setup MySQL database in cPanel](https://www.inmotionhosting.com/support/website/database-setup/create-database-2)**

(<https://www.inmotionhosting.com/support/website/database-setup/create-database-2>) if you are not familiar with how to configure a database if you are not using cPanel the best is to perform few types of research how to create the database via your active control panel.

1. 2.1 Login to cPanel by accessing **www.yourdomain.com/cpanel** (<http://www.yourdomain.com/cpanel>) and navigate go MySQL Databases, note that this step may vary and in some hosting providers can be different.
- 2.2 Create database.
- 2.3 Create a user and set up the user password. (write down the username and the password because needs to be re-used later)
- 2.4 Add the user to the database by selecting the database and the username.
- 2.5 Make sure you have checked All privileges when adding the user to the database.

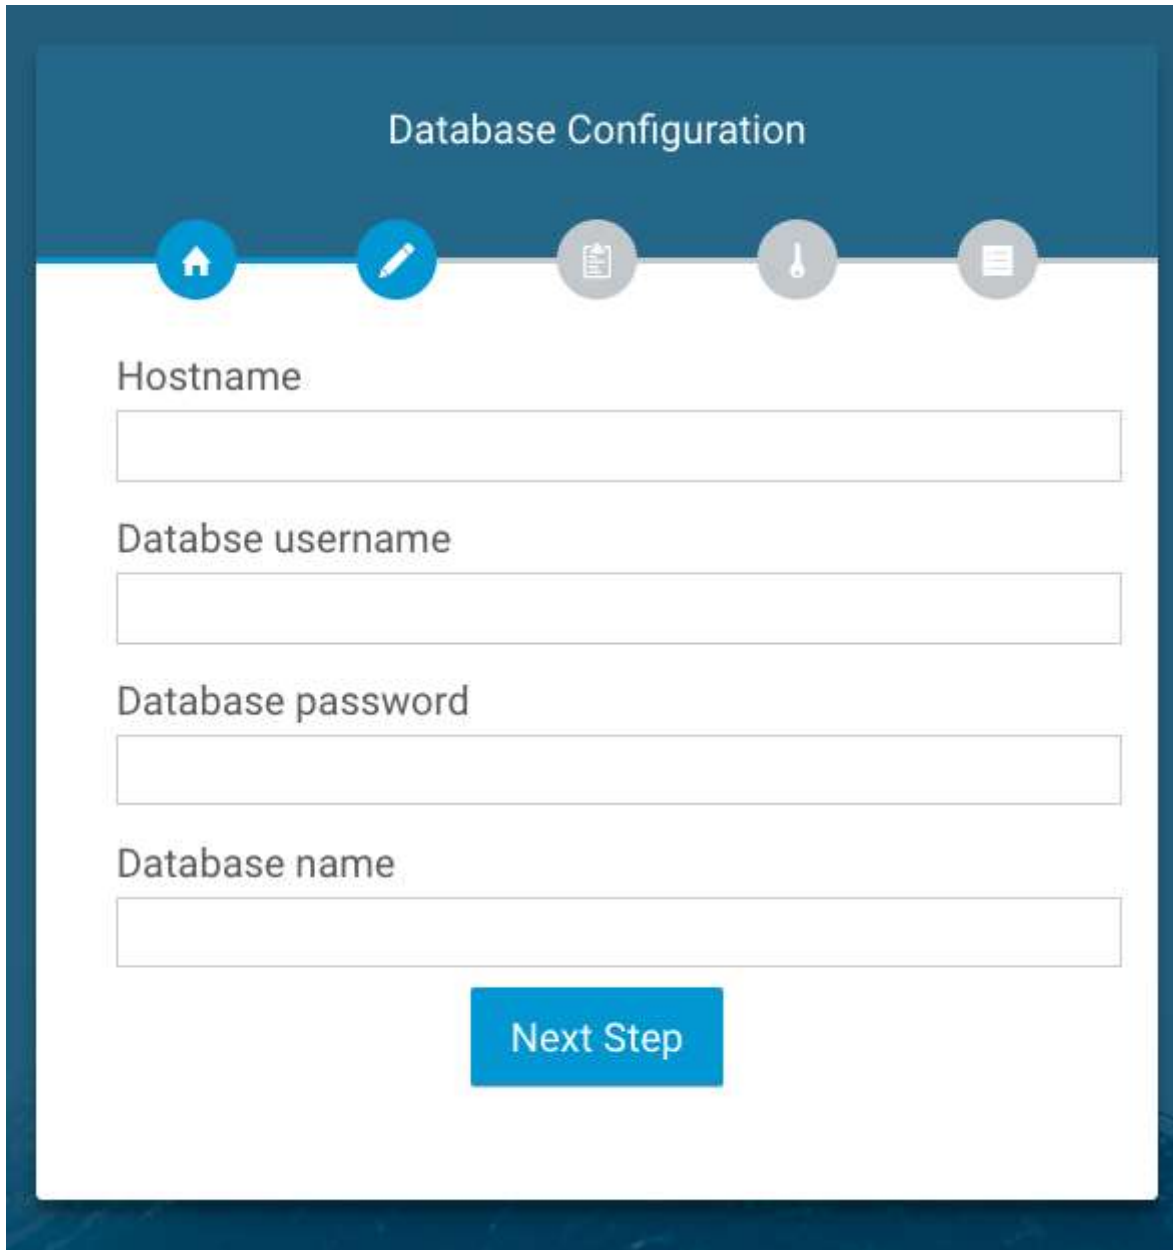

3. Upload files to the server and Installation

- Upload the files to the server folder where Appointo-multivendor will be installed.

3.1 Assume that you uploaded the files to “**appointo-multivendor**” folder, navigate to Eq. <http://yourdomain.com/appointo-multivendor/public/install> (<http://yourdomain.com/pms/public/install>) .

- Keep in mind that you need to adjust the URL based on where you uploaded the files. If you are installing on subdomain named eq pms you need to access the URL like <http://appointo-multivendor.yourdomain.com/public/install> (<http://pms.yourdomain.com/public/install>).
- If none of the above links works then try to open <http://yourdomain.com/appointo-multivendor/public/index.php/install> (<http://yourdomain.com/pms/public/index.php/install>).

3.2 Enter the database credentials you configured in step 1 (configure database) and click **Next Step** button

The screenshot shows a web interface titled "Database Configuration" with a dark blue header. Below the header is a navigation bar with five circular icons: a home icon (blue), a pencil icon (blue), a clipboard icon (grey), a key icon (grey), and a list icon (grey). The main form area is white and contains four labeled input fields: "Hostname", "Database username", "Database password", and "Database name". Each label is in a grey font, and each input field is a simple white rectangle with a thin grey border. At the bottom center of the form is a blue button with the text "Next Step" in white.

3.3 If the database connection is successful you will be passed to the latest step otherwise please re-check your credentials and hostname. (usually, the **hostname** is localhost but you should check with your hosting provider)

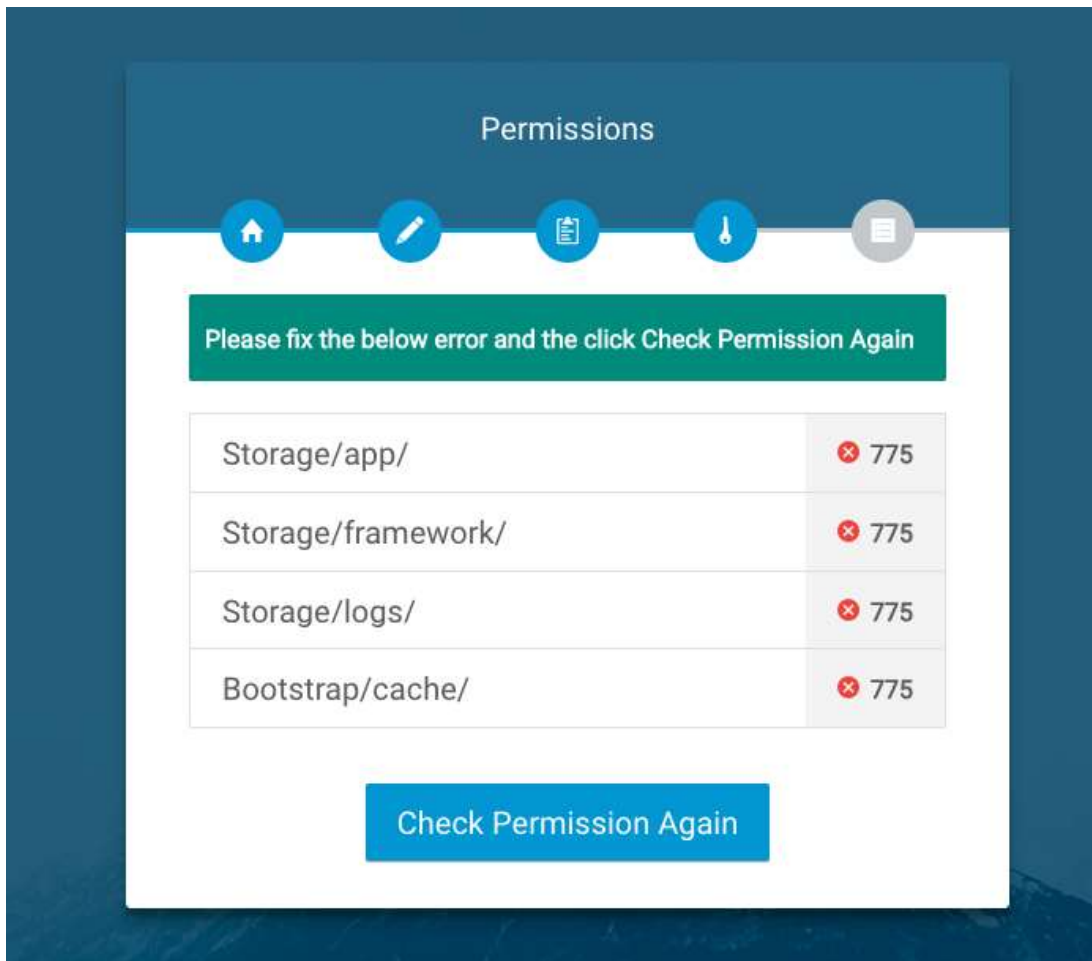

Requirements

PHP Version >= 7.2.5	✓
Openssl	✓
Pdo	✓
Mbstring	✓
Tokenizer	✓
Fileinfo	✓
Curl	✓

Next Step

3.4 Change the directory permission to **775** for the mentioned directories.

3.5 Your application should be installed successfully. Click the Exit button to redirect to the login page.

3.6 To remove **public** from the URL **check this link** (<https://froiden.freshdesk.com/support/solutions/articles/43000491843-remove-public-from-url>).
